

Weatherproof housings

ECO-Protect

For more than 10 years VICOM has been building weather protection housings for projectors of all sizes and performance classes.

The new ECO-Protect series of housings no longer requires air conditioning, but offers almost full climatic protection for the technology it contains. ECO-Protect is designed for moderate to cool climates.

Without
air conditioner

Low energy
consumption

Standardized housings

ECO-Protect M

The new enclosure series ECO-Protect is characterized by its compact design, low weight and attractiveness in terms of price. It has been specially developed for temperate climates e.g. Central Europe.

ECO-Protect weatherproof housings are designed for bright projectors of the medium performance class such as Panasonic PT-RZ21. The exact projector types are listed on the last page.

A sensor-driven air control system with an integrated electronic controller and heater allows year-round operation without an air conditioner. Even at temperatures as low as -25°C, no condensation occurs inside the housing.

ECO-Protect is not suitable for installations that are located near salt water or where humidity is permanently higher than 80%.

In these cases we recommend the use of VICOM COOL-Protect enclosures.

Lockable

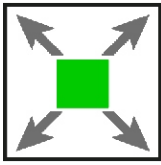

Screwable in the bottom

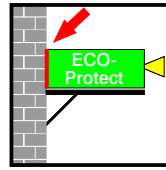

Special version in pylon design
(It's not radar speed camera!)

Special advantages

3 Sizes

ECO Protect are weather protection housings that are supplied in different standard sizes. The right size for every projector is available. Many special developments become unnecessary. However, VICOM also develops special housings, e.g. for multiple projections, projections directly onto the floor, etc.

Wall mounting directly

Based on practical experience, our housings are built in such a way that their rear side can be placed directly against an exterior wall. This way you achieve minimal loss of space. Sufficient ventilation and sensor control ensure the perfect climate inside the housing. This will prevent the projector from overheating.

Rental

We offer ECO-Protect protective housings for sale. Alternatively they can also be rented from us.

Inexpensive

Due to the standardization of the sizes and the production as a serial product, the prices were reduced to a reasonable price level.

Made in Germany

Design, production, quality control and certification are carried out exclusively in Germany.

Protection against external influences

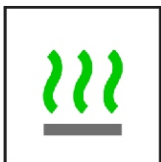

Cold

ECO-Protect housings have a 30 mm thick insulation. Thus, they are designed for severe cold.

Rain

A special focus lies on waterproofness. The long stainless steel feet guarantee that the projector stays dry even in heavy rain.

Heat

During the day there is normally no projection. The housing ensures adequate ventilation during the day and supports the projection in the evening with appropriately powerful fans.

Hail

ECO-Protect housings are made of metal. This means the valuable projector itself is protected against hail.

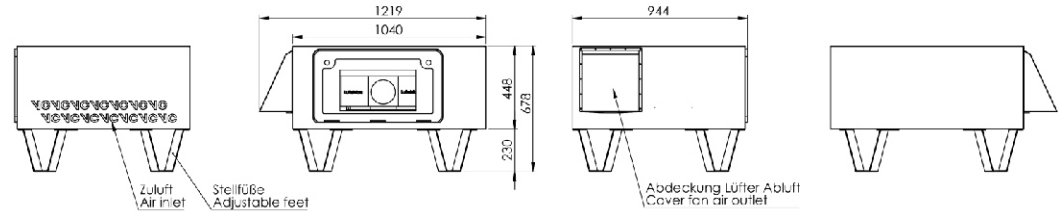

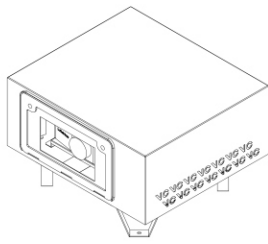

Burglary

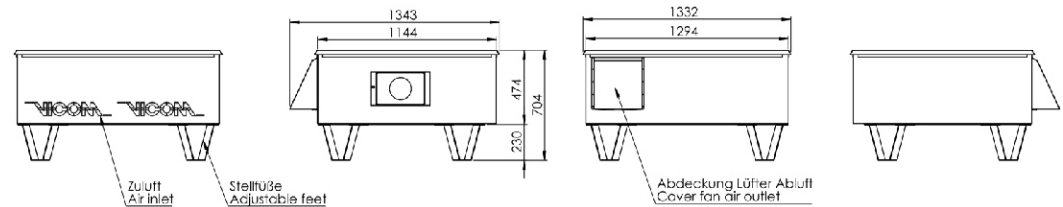

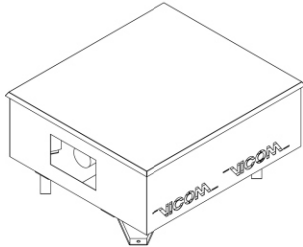

The ECO housing can be bolted onto the floor and has lockable doors and access points.
